The specification describes branched compounds containing nucleic acid moieties optionally extended by a polymerase. The branched chain compounds of the invention are used in nucleic acid synthesis reaction, primer extension reaction, reverse transcription reaction of RNA into DNA, nucleic acid hybridization experiment (for identifying sequence of nucleic acid), and nucleic acid amplification experiment (for analysing the expression pattern of genes). The compounds are also used in solid-phase enzymatic reactions. The present sequence was used in the course of the invention to produce branched chain compounds
                                                                                                                                                                                                                                                                                                                                                                                                    Branched compounds useful in e.g. nucleic acid synthesis reaction comprises nucleic acid moieties optionally extended by a polymerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleotide sequence of oligomer # 1 used to test thermal stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      / Match 0.9%; Score 16; DB 1; Length 16; Local Similarity 100.0%; Pred. This invention relates to oligomuclectide analogues comprising a protein nucleic acid molecule (PNA) monomer. They are used in the detection and separation of nucleic acid molecules and as probes, primers, linkers, adapters and antisense agents on solid supports. Modifications enhance their use as capture and detection probes e.g. by the incorporation of biotin, digoxigenen, radiostopes, fluorescent labels such as lulorescenn and reporter molecules such as alkaline phosphatase. They are also used for enhancing or inhibiting the activity of an enzyme or cellular activity. The compounds are stable to nucleases and proteases, have high affinity, binding specificity and solubility. The polyamide backbone of PNAs is resistant to both nucleases and proteases. PNAs bind nucleic acid molecules with greater affinity than DNA or RNA concentration. The compounds are relatively simple to synthesize and are used in a wide variety of applications. This sequence represents a DNA oligomer which is used to represent the thermal stability of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                       Oligonucleotides analogs useful in detection, separation and purification of nucleic acid molecules, comprise monomers, dimers and oligomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2'F-ANA antisense oligo #6, to elicit RNase H degradation of target RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /*tag= b

a sample, which comprises: contacting and properties of containing a target polynucleotide with a predetermined single-stranded sensor polynucleotide complementary to the target polynucleotide, in a solution comprising an agent that its a nonaqueous solvent that allows the sensor polynucleotide to produce a detectable fluorescence emission; exciting the sensor polynucleotide, and determining fluorescence emission. The assay is useful for detecting a single or double-stranded target polynucleotide, such as, DNA or RNA in a sample. The assay finds use in a polynucleotide, such as, DNA or RNA in a sample. The assay finds use in a wide variety of different applications includual which was the source of a forensic specimen, in anthropological setting, paternity forensic specimen, in anthropological setting, paternity casting for compatibility between prospective tissue or blood chonors and patients and in screening for hereditary disorders. The method is also useful to study alterations of gene expression in response to a stimulus, disease, drug or medication, and other applications include tharacterisation of human haplotype diversity. The method is useful for detecting polynucleotide sequences from contaminants or pathogens including bacterial, yeast, and viruses to detect single nucleotide polymorphisms, which may be associated with particular alleles or subsets of alleles. The method is useful for detection of mutan between the distance of males or subsets of alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disorders including cystic fibrosis, Tay-Sachs, and sickle-cell anaemia. This polynucleotide sequence represents an oligonucleotide sequence used in a fluorescence technique of the invention
                                                                                                                                                                                                                                                                                                         The invention relates to a novel assay for detecting a polynucleotide in
                                                               Detecting polynucleotides, for pharmacogenetic testing, comprises contacting a target polynucleotide with a complementary single-stranded sensor polynucleotide and an agent that allows the sensor to fluoresce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleotide sequences associated with increased risk of diseases or

Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary they are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification of the invention

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a fordition associated with the level of the fms-like tyrosine kinase 1 (flc-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAXX7155 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                             mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flk-1; MSR; hammerhead ribozyme; cleavage; tumour angiogenesis; psorials; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                     Nucleic acid molecule modulating VEGF receptor(a) gene expression or stability – useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method of inhibiting the expression of one or more genes or RNA transcripts by administering at least one oligonucleotide analogue that includes at least one hydroxyproline nucleic acid (HypNA) monomer to a cell or organism or their extracts. Throligonucleotides of the invention may be used to monitor properties oligonucleotides of the invention may be used to monitor properties channel activity, cell motility, developmental phenotype and tumour regression. Furthermore, they may be utilised to determine the effects of particular genes, as antisense or homologous recombination constructs e.g. for creating animal models of disease and finally, for increasing the activity of some enzymes, such as polymerases. The current sequence is that of the DNA hybridisation oligomer SEQ ID 9 of the invention. This sequence may also comprise a peptide nucleic acid (PNA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                           Method of inhibiting expression of genes or RNA transcripts, useful for therapy and determining effects of genes, by administering oligomers containing hydroxyproline nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

(preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a PCR primer used in the identification of a human pollanosis associated gene. The gene is highly expressed in individuals with high pollen-specific immunoglobulin E (IgE) levels. The invention relates to the nucleotide sequence encoding the pollenosis associated protein, diagnosing pollenosis and screening candidate compounds for treating pollenosis. The gene can be used in diagnosing pollenosis, and screening candidate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pollenosis-associated protein; high pollen-specific immunoglobulin E; IgE; diagnose; cedar pollenosis; treatment; human; PCR primer; ss.

The present invention describes a providing a nucleic acid sample comprising: (a) providing a nucleic acid sample comprising: (a) providing a nucleic acid sample comprising: (a) providing a nucleic acid sample; (b) providing and providing one or a portion of sequences, and providing one or a portion of sequence of the nucleic acid sample; (b) mixing and hybridizing the nucleic acid sample with probes; (c) subsequently recovering nucleic acid sample with probes; (c) subsequently recovering nucleic acid sample with probes; (c) substantially complementary to a portion of sequence of the nucleic acid sample having a plurality of kinds of probes having a known sequence of two nucleic acid sample with the corryme or the probe itself; and (iv) subsequently recovering the nucleic acid sample with the probes; (ii) mixing and hybridizing the nuclease activity of an enigmence or the probe itself; and (iv) subsequently recovering the nucleic acid sample having a plurality of species of sequences and oligonucleotides primer having predetermined sequences for synthesizing DNA strands; (II) providing one or a plurality to a portion of a sequence of the nucleic acid sample having such a structure to probe having a known sequence substantially complementary to a portion of a sequence of the nucleic acid sample having such a structure to prevent a polymerase reaction from its 3' end and a nuclease reaction from its 3' end and a nuclease reaction for the samples prepared in (III); and (v) subsequently recovering nucleic acid sample for the analysis of rare expressed caid molecules synthesized in (IV). The method is useful for the acid molecules synthesized in (IV) rhe method is useful for the sequence of sequence represents a pCR primer used in the expressed in the primer and sequence represents a pCR primer securing nucleic acid sample prepared in the primer and sequence represents a pCR primer used in the primer secure or sequence acid sample prepared in the sequence acid sample primer and sequence acid sample sequence acid sam
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Preparation of nucleic acid sample, useful for analysis of rare expressed

This invention describes novel DNA sequences preferentially expressed in IgA nephropathy patients, and DNA sequences stringently hybridizing to IgA nephropathy patient claims cover diagnostic reagents for IgA nephropathy incorporating the antisense sequences; the treatment of IgA nephropathy using the antisense sequences for mRNA inhibition; proteins associated with IgA nephropathy, containing sequences encoded by the DNA sequences; antibodies recognizing these proteins; the production of the proteins by culture of host cells transformed with DNA encoding them; diagnostic reagents for IgA nephropathy containing the antibodies; and compositions for the treatment of IgA nephropathy which contain the antibodies. The products of the invention can be used for the diagnosis and treatment of IgA nephropathy. This sequence represents a primer used in the isolation and identification of the human IgA nephropathy-associated proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Anchored oligo (dT) primer GT15G used for modified differential display.

The specification describes a method for measuring the level of two or more nucleic acid molecules in a trarget. The method comprises contacting a probe with an arbitrarily or statistically sampled target and detecting the amount of specific binding of the target to the probe. The methods can be used to identify differentially expressed nucleic acid molecules associated with disease states, such as cancer, autoimmune disease, infectious disease, aging, developmental disorder, proliferative disorder or neurological disorder. Alternatively the methods can be used to assess the efficacy or toxicity of or a resistance to a treatment. Also the methods can be used to determine differential expression of nucleic acid molecules in response
              Stimulus-regulated nucleic acid; sequence profile; nucleic acid level; differentially expressed nucleic acid; disease state; cancer; autoimmune disease; infectious disease; aging; developmental disorder; proliferative disorder; neurological disorder; toxicity; primer; treatment resistance; differential expression; drug discovery; growth factor; epidermal growth factor; radiation; stress; pathogen; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Measuring expression of low abundance reduced complexity target nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         to a stimulus, e.g. a chemical, drug or growth factor (especially epidermal growth factor), radiation, stress or a pathogen. The methods can also be used to determine co-regulated genes that can be potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1947

```
The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate with a target sequence and contain at least one phosphoro(di)thioate contains a dead of the describerally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor.

Gene, are used to treat cancer (particularly of breast or endometrium), contain violations associated with levels of oestrogen receptor.

Governlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endomucleases are used with DNA). The combination of therapeutic rargets, and as research casenace to mucleases, binding affinity and/or activity. AAA21503 to AAA24747 represent oestrogen receptor harmerhead ribozyme sequences.

AAA24747 represent oestrogen receptor harmerhead ribozyme sequences.

AAA24748 to AAA25052 represent their corresponding target sequences.

Sequences, and AAA26107 to AAA26211 represent their corresponding target sequences and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acids that interact, and optionally cleave, target sequences,
                                                                                                                                                                                                                                                                                           Thompson JD, Beigelman L, Mcswiggen JA, Karpeisky A, Bellon L;

Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1952

Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; hairpin ribozyme; antisense oligonucleotide; gene expression modification; cancer; phosphorothioate; endonuclease; anticancer; breast cancer; endometrium cancer; ss.

WO200065046-A1

Synthetic

Homo sapiens

```
with a target sequence and contain at least one phosphoroid;) thioate with a target sequence and contain at least one phosphoroid;) thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor.

Gene, are used to treat cander (particularly of breast or endometrium).

Cor other conditions associated with levels of oestrogen receptor.

Correlate inhibition of gene expression with alterations in phenotype, correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endomucleases are used with DNA). The combination of modifications in (A) improves the sistance to nucleases, binding affinity and/or activity. AAA22503 to AAA24748 to AAA2592 represent their corresponding target sequences.

Company of AAA2503 represent cestrogen receptor hairpin riboxyme sequences, and AAA26107 to AAA26171 represent their corresponding target sequences.

Company of AAA26107 to AAA26171 represent their riboxyme sequences and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                        New nucleic acids that interact, and optionally cleave, target sequences used to treat cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, pollinosis-associated gene 373; IgE; immunoglobulin E; cedar pollen allergy; T-cell; reduced expression; detection; diagnosis; drug screening; allergic disease; PCR primer; ss.

The invention relates to the human pollinosis-associated gene 373 which with high cadar pollen-specific IGE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cadar pollen using the differential display method. The invention also relates also relates to the protein encoded by pollinosis gene 373; expression constructs and host cells comprising pollinosis-associated gene 373 nucleic acids; pollinosis-associated gene 373 nucleic acids; protein encoded by the gene; methods of detection of pollinosis-associated gene 373 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 373 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 373 nucleic acids; acids. The invention additionally encompasses methods of screening drug acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic diseases by measuring the expression of pollinosis-associated gene 373 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control.

T-cells in the presence of a test compound relative to a control.

Condidates for the treatment of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the custom in the general sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 373 cDNA
                                                                                                                                                                                                                                                                                                                                      Pollinosia-associated gene 373 undergoing significantly low expression in subjects with high cedar pollen-specific immunoglobulin-E levels, useful in diagnosis of allergic diseases and screening drug candidates.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 6; Page 70; 80pp; Japanese.

Pollinosis-associated gene 419 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates.

Example 6; Page 50; 77pp; Japanese.

The invention relates to the human pollinosis-associated gene 419 which exhibits reduced expression in the T-cells of individuals with high cedar pollen specific IgB (immunoglobulin E) levels. The gene was isolated from collen expecific IgB (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 419 has homology with the gene encoding human Pas-associated Gactor-1 (PAR-1). The invention also relates to the protein encoded by pollinosis gene 419; expression crelates to the protein encoded by pollinosis gene 419; primers and probes; antibodies against the protein encoded by the gene; method of detection of pollinosis-associated gene 419 pucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 419 in the intended of sereening drug candidates for the treatment of allergic methods of screening drug candidates for the treatment of allergic compound relative to a control.Pollinosis-associated gene 419 is useful in the screening of drug candidates control diseases and in the screening of drug candidates (for the treatment of such diseases). The presente requence represents a PCR primer used in the isolation of human pollinosis-associated gene 419 cDNA

Pollinosis-associated gene 795 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates.

Page 46; Example 6; 73pp; Japanese.

exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin B) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 795 has homology with the human vimentin gene. The invention also relates also relates to the protein encoded by pollinosis gene 795; to expression constructs and host cells comprising pollinosis-associated gene 795 nucleic acids; pollinosis-associated gene 795 nucleic acids; pollinosis-associated gene 795 armers and probes; antibodies against the protein encoded by the gene; methods of detection The invention relates to the human pollinosis-associated gene 795 which

The present invention describes the human pollinosis-associated gene 465 which has a nucleic acid sequence of 3442 base pairs (bp), given in (AAC92291), that undergoes significantly low expression in subjects after pollen scattering, and is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The gene is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The present sequence represents a PCR primer which is used in an example from the present invention

Example 6; Page 44; 61pp; Japanese.

This invention describes a novel nucleic acid molecule comprising a sequence (I) which undergoes significantly low expression in subjects after pollen scattering, and is useful in disgnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gunji S;

The invention provides a method of diagnosis of allergies that involves: assaying the levels of expression of genes B1001, B1466, B1072 or B1151 in T-cells; and comparing them with the level of expression in healthy T-cells. The method is useful for diagnosing allergies, particularly atopic dermatitis. The present sequence represents a PCR primer used for analysis of the expression of the above genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            comparing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Providing mRNA profile, by generating two independent patterns characteristic of sample mRNA population, analyzing patterns, comparing gene expression by cell types under varied conditions, and identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identification of transcribed gene; mRNA profile; gene expression; cellular process; fingerprinting; susceptibility to external factor; development; disease; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5'-PCR primer used to produce single pattern characteristic by FokI.

                                                                The present invention relates to a method for providing a profile of mRNA molecules present in a sample. The method comprises generating two independent patterns characteristic of the population of mRNA molecules expressed in the sample and analysing the patterns using a combinatorial algorithm, comparing gene expression by different or same cell types under different conditions, and identifying genes having a role in identification of transcribed genes, and fingerprinting. The method can be used to identify genes which play a role in determining various cellular processes, including susceptibility to external factors, development, and disease. The present esquence for a PCR primer is used in the production of a single pattern characteristic of a sample, employing a Type IIS restriction enzyme (i.e. FoXI) in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 stage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, 88; PCR; acetyltransferase, 20-90-05; allergic disease, primer, differential display; eosinophil; antiallergic; atopic dermatitis; GT15G.

candidate compounds which that in the eosinophils of a healthy individual

(i.e. differential display). Also included are methods of screening for
candidate compounds which affect the expression level of the gene or the
activity of the protein encoded by the gene (including related proteins
and mutants), the use of probes based on the gene sequence in the
examination of allergic diseases, the use of reporter constructs in the
controlling region of the gene, cells transformed with the vector, an
controlling region of the gene, cells transformed with the vector, an
intendity against the protein and a model animal for allergic diseases
which is a transgenic non-human vertebrate with lowering of expression
intensity of the gene in eosinophils. The method is examining allergic
diseases particularly atopic dermatitis which is also applicable in
screening candidate compounds for remedies. Such method can be performed
in high throughput, at low cost. The present sequence is a differential
display PCR primer for the cDNA encoding the human acetyltransferase-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes a method for examining allergosis. The method comprises measuring the expression level of the gene given in ABL59037, and comparing it with the expression level of the gene in the eosinophils of a healthy person. The method is used for the examination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequence represents a PCR primer, which is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Examining allergosis, involves measuring the expression levels of a specific gene, and comparing it to the levels in the ecsinophils of healthy control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The method can be used to examine allergic diseases, particularly atopic dermatitis, and its early diagnosis, which is also applicable in screening candidate compounds for remedies. The present sequence is a PCR primer described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                   Method for examining allergic diseases by differential display of seventeen genes showing different expression particularly significant increase in eosinophils in patients with mild atopic dermatitis, also applicable in screening compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

```
The present invention relates to a method for examining allergic diseases with intersectin 2 as an indicator gene, which comprises determining the expression level of the gene in the cosinophils in a patient, and comparing the expression level with that in the cosinophils of a healthy individual. The method is for examining allergic diseases, particularly atopic dermatitis, which is also applicable in screening candidate compounds for remedies. The present sequence is an anchor primer described in the exemplification of
                                                                                                                                                       Method for examining allergic diseases by differential display of intersectin 2 gene showing different expression particularly significant increase in eosinophils in patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Atopic dermatitis; ss; differential display; primer; PCR; eosinophil; allergic disease; antiallergic; dermatological; GT15g.

These sequences are used in a novel method for examining allergic diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     genes showing

vaccines. The present sequence was used to illustrate the invention

```
The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ2, MDZ3 is concoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p21.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for disquosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross acids can also be used as probes to detect and characterize gross useful in constructing microarrays for measuring gene expression. The probes are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                              ö
comprising determining the expression levels of these genes and comparing the expression level with that in the eosinophils of a healthy individual. The method of the invention may have antiallergic of dermatclogical activities. The method can be used to diagnose allergic diseases particularly atopic dermatitis, and may also be used to screen candidate compounds for remedies. The method of the invention can be performed in high throughput, at low cost. The present sequence represents the GTLSg PCR primer used to amplify the differentially amplified atopic dermatitis related cDNA sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New zinc finger-containing proteins and nucleic acids, useful in
manufacturing a medicament for treating or preventing a disorder
associated with decreased or increased expression or activity of MDZ3,
MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                 Gaps

proteins and their coding sequences: MD23, MD21, MD212. MD23 is encoded at chromosome 7q22.1, MD24 is encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2, mD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder cor in manufacturing a medicament for treating or preventing a disorder. Cor in manufacturing a medicament of expression or activity of MD23, MD24, MD27, or MD212, monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids and proteins are also useful for disquosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212 genetic locus. The probes are also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to determining the presence of and/or identifying a polyadenylation site within a sequence of a transcribed gene or variants present in a sample. The method involves assigning to gene fragments gene candidates within a database by comparing signals in the dataset with the database, the database comprising data representing mRNAs with known colyA sites and/or 'vitutal genes' representing a possible party and/or 'vitutal genes' representing a possible colyA sites and/or vitutal genes' representing a possible colyAdenylation site within an actual gene. The method is useful for determining the presence of and/or identifying a polyadenylation site or sequences of transcribed gene variants present or potentially present or sequence sequence variants that occur in a population of differences between sequence variants that occur in a population of ancleic acid molecules, especially in identifying or discovering polyA site usage or determining polyA site usage in a nucleic acid sample, and gene variants from a first present sequence contributed to the present sequence ariants from a first present sequence contributed to the present c
                                                                                                                                                                                                                                                                                 Determining polyadenylation sites within transcribed gene sequences present in a sample comprises assigning to gene fragments gene candidates within a database by comparing signals in the dataset with the database.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of a primer used in the invention. The invention relates to a novel nucleic acid (see ABZ70560) encoding Aspergillus phoenices oxalate decarboxylase (APOXD) (see ABP72475). The gene and its encoded protein are useful in degrading oxalate, in diagnostic assays, for protecting plants against disease, and as a
                                                                                                                                                                                                                                                                                                                                 Aspergillus phoenices; oxalate decarboxylase; APOXD; transgenic plant;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

New naturally derived DNA specifically expressed during blastogenesis of a plant, useful for producing a transformed plant and for compulsive expression of a protein.
                                                                                                                                                                  The invention relates to producing a population of double-stranded product DNA molecules comprising amplification by a nested PCK method. The method is useful in profiling mRNA transcribed in a system under investigation. The oligonuclectides are used as size standards in electrophoresis, and as internal controls allowing for calculation of relative amounts of material present. The present sequence represents adouble stranded product DNA, which aids in outlining an approach to production of a single pattern characteristic of a sample, employing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               during plant blastogenesis. The DNA of the invention is useful for producing a transformed plant. Methods of the invention are also useful for compulsive expression of this DNA. Methods of the invention are useful for plant tissue specific expression of genes. Also, the growth stage of a plant can be controlled specifically. The current sequence represents a PCR primer for amplifying a plant blastogenesis specific gene of the invention.
                                                                  Producing a population of double-stranded product DNA molecules, useful for mRNA profiling, comprises amplification by nested polymerase chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primer for amplifying plant blastogenesis specific gene #SEQ ID 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Plant blastogenesis; transformation; gene expression; tissue specific;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel apoptosis-related DNAs and proteins - for diagnosis, preventing treating diseases associated with apoptosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as a spoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel apoptosis-related DNAs and proteins - for diagnosis, preventing or treating diseases associated with apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel apoptosis-related DNAs and proteins - for diagnosis, preventing treating diseases associated with apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
PCR; primer; amplification; apoptosis; antibody; inhibition; ss; immunohistological staining.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    88;

This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis p.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as a apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and aleep apnea syndrome. The genes (AA29061-633) and the proteins (AAY67598-Y6700) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A physiologically active protein specifically derived from mammal tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Adipose tissue; obesity; diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss

The present invention describes a method of producing binary sequence tags from nucleic acid fragments in a sample, involving incubating the sample with cleaving reagents, mixing offest adaptors with the sample, incubating with more cleaving reagents and mixing the sample with adaptors are coupled to binary sequence tags. The method is useful in sequence analysis, including analysis and comparison
                                                                                                                         The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperunicemia and aleep apnea syndrome. The genes (AAZ9061-633) and the proteins (AAY67598-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes
                                        A physiologically active protein specifically derived from mammal tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Producing binary sequence tags, useful for analyzing nucleic acid sequence tags, gene expression or gene-expression patterns, involves generating nucleic acid fragments, which are mixed with offset adaptors
                                                                                                                                                                                                                                                                                                                                           / Match 0.9%; Score 16; DB 1; Length 18; Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnea syndrome. The genes (AAZ9661-633) and the proteins (AAV67589-V67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A physiologically active protein specifically derived from mammal tissue.
                                                                                                                                                                      Adipose tissue; obesity; diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Adipose tissue; obesity; diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention relates to a new method for identifying compounds for treating and/or preventing cytomegalovirus (CWV) infection and/or related diseases. The method of the invention comprises contacting a test compound with at least nee of the cellular kinases RICK, RIP, Nck-Interacting kinase, MKK3 and SRRK-2 and detecting any change in kinase activity. The method of the invention can be used to treat and/or prevent CWV infections and related diseases. Oligomucleotides that can detect the specified kinases can also be used for diagnosis of infection. The spreamt nucleic acid sequence represents human CMV reverse transcriptase (RT)-PCR primer TXN that was used in the methods of the invention for preparation of radioactively labelled cDNA probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying agents for treatment or prevention of cytomegalovirus infection, comprises contacting test compound with cellular kinase and detecting change in cellular kinase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Human cytomegalovirus; HCMV; virucide; cytomegalovirus infection; CMV; cellular kinase; RICK; RIP; Nck-Interacting kinase; MKX3; SRPK-2; reverse transcriptase PCR; RT-PCR; primer; ss.

The invention relates to novel pyridylpyrimidine derivatives and methods of detecting prion infections and/or prion disease in an individual or in cells. Cells. Cells. Cells involves adding at least one monoclonal or polyclonal antibody, oligonucleotide or pyridylpyrimidine derivative to the sample or in cells, cell cultures and/or pyrimidine derivative to the sample or in cells, cell cultures and/or cell lysates and detecting the activity of at least one human cellular protein kinases (e.g., FGF-RI (also known as flg, Fl-1, Fl-2, b-FGFR), Tk (also known as CCK-2, DDR-2 or EDDR, EC number 2.7.1.112), Abl (also known as CCK-1), PRK), human cellular protein phosphatases such as FTP-SL (Also known as CDK1), PRK), human cellular protein phosphatases such as FTP-SL (Also known as GDK1), PRK), human cellular signal transduction of prions in cells and in the manufacture of pharmaceutical composition for prophylaxis and/or treatment of infectious disease (e.g. Scrapie, chronic wasting disease (CWD), transmissible mink encephalopathy (IMR), or neurodegenerative disease (CWD), bovine spongiform encephalopathy (BSE), variant CJD, Gerstmann-Straussler-Scheinker syndrome (GSS), fatal familial insomnia (FFI), Kuru and Alpers syndrome, especially BSE, CJD, or reuuchdegenerative diseases (e.g., Alzheimer's disease) in humans or ruminants. The present DNA sequence is a primer used to prepare correspondence is a primer used to prepare in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention describes a compound (I) of 8 - 50 nucleotides targeted to a nucleic acid molecule (II) encoding tumour necrosis factor (TNF) inducible protein, A20, and which specifically hybridises with and inhibits expression of A20, or a compound (Ia) of 8 - 50 nucleotides with and inhibits expression of A20, or a compound (Ia) of 8 - 50 nucleotides with and huck and antiviral activities. (I) can be used as inhibitors of TNF inducible protein, A20. (I) is useful for inhibiting the expression of A20 in cells or tissues, and for treating an animal having a disease condition associated with A20, e.g. a inflammatory disorder, viral infection and hyperproliferative disorder e.g. cancer. (I) is also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. (I) is also useful as therapeutic, diagnostic and research reagent, for cuseful as therapeutic, diagnostic and research reagent, for consecution of various members of a biological pathway, and in antisense gene therapy. The present sequence represents an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound useful for preventing or delaying infection, inflammation or tumor formation, hybridizes and inhibits a nucleic acid molecule encoding tumor necrosis factor inducible protein, A20.

RESULT 891
```

```
The invention relates to diagnosis of hepatitis B virus (HBV) infection stages comprising identification of full length HBV transcripts (I) and truncated HBV transcripts (II) in a serum sample, where the ratio of I:II is indicative of a particular infection stage. The method is useful for happrocation HBV infections atages and determining the risk for developing hepatocallular carcinoma. The present sequence is that of a HBV diagnostic PCR primer, useful for the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing hepatitis B virus (HBV) infection stages and determining the risk for hepatocellular carcinoma, comprises identifying full length HBV transcripts and truncated HBV transcripts in a serum sample.
                                                                                                                                                                                                                                                                                                                                                                   Hepatitis B virus; HBV; infection; hepatocellular carcinoma; diagnosis;
oligonucleotide for human TNF inducible protein A20, from the present

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding regaion, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entilnflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of, or reducing sensitivity to adenosine, reducing levels of ung surfactant in a subject, for retaring bronchodilation, increasing levels of ung surfactant in a subject, or treating pronchonstriction, increasing levels of ung surfactant in a subject or treating bronchodilation, increasing levels of ung surfactant in a subject or treating pronchonstriction, increasing levels of ung surfactant in a subject or treating bronchonstriction, increasing levels of ungenty or treating surfactant in a subject or treating bronchonstriction, increasing levels of ungenty or treating surfactant in a subject or treating bronchonstriction, increasing levels of ungenty or dependenty or treating surfactant in a subject or treating surfactant in a subject or treating bronchonstriction, increasing levels of ungenty or treating surfactant in a subject or treating surfactant in a subject or treating bronchonstriction, increasing levels of condition.
                                                                                                                                                                                                                                                                                                                        Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 16; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for calibrating data scanned from a molecular array. The method involves employing calibration probes that generate signals proportional to the total concentrations of labelled target molecules to which the molecular array probes are directed over an entire range of sample solutions and molecular arrays incorporating sets of calibration probes. Method is useful for calibrating different types of signals scanned from a molecular array, or calibrating signals scanned from a molecular array, or calibrating signals scanned from different molecular arrays. The present sequence is poly (A)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Calibration of molecular array data by employing calibration probes that generate signals proportional to total concentrations of labeled target molecules, and molecular arrays incorporating sets of calibration probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, antisense, lung dysfunction, nasal airway dysfunction, antiinflammatory, steroid, ubiquinone, antiinflammatory, antiallergic, antisathmatic, hypotensive, immunosuppressive, cytostatic, gene therapy, antisense gene therapy, respiratory, lung, adenosine sensitivity, adenosine receptor, bronchodilation, bronchoconstriction; lung allergy,

nervous system Query Match Matches Analysis of DNA fragment - comprises addition of known common oligonucleotide, amplification of resultant DNA fragment and analysis and labelling of amplified DNA. which comprises: (i) addition of a known common oligonuclectide sequence to at least one terminal of each DNA fragment; (ii) amplification of the resultant DNA fragment as a primer using a first common primer containing a complementary nuclectide sequence to the above mentioned known common oligonuclectide sequence, a second common primer containing a complementary nucleotide sequence to the prepared known common oligonucleotide sequence optionally having been introduced with complementary nucleotide sequence at a terminal, and a specific primer capable of hybridisation with a DNA fragment containing whole or part of the amplified DNA to find the information of the DNA fragment; in which the specific primer is designed to prepare fragments of the common first and second primers and to give short fragment of the common first and second primers and to give short fragment of amplified DNA and (iv) labelling them to make their differentiation of informations of known and unknown genes readily provides information of whitnown gene and simultaneous monitoring of signals derived from minor genes. Furthermore, labelling of DNAs according to functions of known genes can be performed. AAZ09189-Z09201 represent oligonucleotide primers This invention descibes a novel method for the analysis of a DNA fragment used to illustrate the method of the invention Example 1; Page 12; 17pp; Japanese.

Melanoma differentiation associated gene-7 promoter capable for treating cancer comprises directing transcription of heterologous coding sequence encoding tumor suppressor polypeptide positioned downstream, useful for Example 2; Page 70; 132pp; English

The present sequence is that of a sense primer flanking the region corresponding to the putative AP-1 and C/EBP binding sites present between Ndel and Nbel restriction enzyme sites in the human melanoma differentiation associated gene-7 (maa-7) promoter (see AAH26595). The sense primer and an antisense primer (see AAH26602) were used in the PCR amplification of this region of the promoter. The PCR product was used in a electrophoretic mobility shift assay (EMSA) which demonstrated that CUUN/AP-1 and C/EBP-beta transcription factors bind to defined sites within the mda-7 promoter during the process of terminal differentiation constructs in which the mda-7 promoter is operably linked to a coding sequence encoding a tumour suppressor protein. A pharmaceutical composition including the recombinant expression construct is used in a claimed method of treating melanoma, neuroblastoma astrocytoma, glioblastoma multiforme, cervical cancer, breast cancer, colon cancer, processe cancer, osteosarcoma, chondrosarcoma or a cancer of the central

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 13; Page 124; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 Al (CYP4501Al), cytochrome P450 Al (CYP4501Al), cytochrome P450 Al (CYP4501Al), cytochrome P450 Al (CYP4501Al), cytochrome P450 OZEI (CYP4501Al), adrenergic receptor betal (ADBRI), cytochrome P450 OZEI (CYP5501Al), adrenergic receptor betal (ADBRI), cytochrome P450 OZEI (CYP5501Al), adrenergic receptor betal (ADBRI), cytochrome P450 OZEI (CYP55), aryl hydrocarbon receptor nuclear translocator (ARNY), cathepsin S (CTSS), cyclooxegense 2 (CXC2), diazepam binding cransferase (HNMY), RADPH quinone-S-transferase 2 (KNWT), hydralikrah 2) KuK2, nicothamide -N-methyl cransferase (HNMY), RADPH quinone soridoreductase 2 (KNQ2), culfortansferase thermolabile (SYM), UDP-glucuronosyl transferase 2BH (UGT2BI), unclear acedeptor (KNRP3), corphan nuclear receptor (KNRP3), cytophan markers for locating and characterising the genes that care responsible for specific traits within the genome and eventually care responsible for specific traits within the genome and eventually conforting the discorders. The nuclear caid molecules comprising the colymorphic sequences contained in CYP4501A, CYP94501A, CONSTILLING C peripheral nervous system function. The present sequence represents a sequencing primer used to sequence the polymorphic genes of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method for calibrating data scanned from a molecular array. The method involves employing calibration probes that generate signals proportional to the total concentrations of labelled target molecules to which the molecular array probes are directed over an entire range of sample solutions and molecular arrays incorporating sets of calibration probes. Method is useful for calibrating different types of signals scanned from a molecular array, or calibrating signals scanned
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Calibration of molecular array data by employing calibration probes that generate signals proportional to total concentrations of labeled target molecules, and molecular arrays incorporating sets of calibration probes.

                                                                                                                                                         The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.
New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

/note= "at least one (and preferably all) of the backbone subunits are composed of amide units, so that the oligomer consists of the nucleobases attached covalently to a polyamide backbone"
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense oligonucleotides which target human ELAM-1 were synthesised in the phosphorothioate form. The oligonucleotides are useful to treat diseases which are modulated by changes in intercellular adhesion molecules. This sequence corresponds to nucleotides 2063-2082 of the 3'-untranslated region of human ELAM-1 coding sequence. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                          Oligo:nucleotide modulation of cell adhesion - used in the treatment of e.g. psoriasis, inflammatory bowel disease or malignant melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peptide nucleic acid; PNA; intercellular adhesion molecule; ICAM-1; endothelial leukocyte; ELAM-1; vascular; VCAM-1; antiinflammatory; anticancer; antimetastatic; anti-AIDS; anti-rhinoviral; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  원
                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipaoriatic, extratolytic and virucide activities, and cleaves RNA encoding (1). (1) can have antipaoriatic, and segment encoding (1). (1) can have antipaoriatic, and gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, diseases such as psoriasis, atopic dermatitis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such, as keloid, adhesion and hypertrophic or hypertrophic burn control of the control o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                              Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human endothelial leukocyte adhesion molecule; ELAM-1; cell adhesion; modulation; inflammation; psoriasis; malignant melanoma; inhibition; inflammatory bowel disease; antisense oligonucleotide; therapy; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAA29827,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                          New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, coding region, 5-untranslated region or 3'-untranslated region of ICAM-1 or ELAM-1, or hybridisable to AUG region, coding region, 5-untranslated region, exon/intron junction region or 3'-untranslated region of VCAM-1.

The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cellular adhesion and thus as antimetastatic agents, anticancer agents, antirhinvoiral agents, anti-1.

AIDS agents and antilinflammantory agents. They may also be useful as diagnostics, e.g. as probes for specific mRNAs. PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with the resulting double helix or with the first PNA strand. The PNAs possess no significant charge and are water soluble, which facilitates cellular uptake. Further, since they contain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                           New peptide nucleic acid oligomers hybridising to adhesion molecule genes - are stable anti:sense cpds. of high affinity, partic. for treating inflammation, viral infection, cancer etc.
                                                                                                                                                                                                                                                                                                                                                                                    amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases. The present sequence targets endothelial leukocyte adhesion molecule-1 (BLAM-1) 3'-untranslated region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ICAM-1; endochelial leukocyte adhesion molecule-1; ELAM-1; E-selectin; vascular cell adhesion molecule-1; VCAM-1; white blood cell; brequinar; vascular endothelium; allograft rejection; immunosuppression; rapamycin; anti-lymphocyte serum; monoclonal antibody; cardiac allograft; therapy; renal allograft rejection; donor-specific transplant tolerance; LFA-1;

Antisense compound specifically hybridizing and inhibiting the expression of human Jun N-terminal kinase kinase-2 is useful for treating infection, inflammation and tumor.

Claim 3; Col 40; 31pp; English.

The present invention describes an antisense compound (I) of 8-30 nucleobases, specifically hybridising to, and inhibiting expression of, human jun N-terminal kinase kinase-2 (JKK-2). Also described is a method of inhibiting the expression of human JKK-2 in human cells or tissues, comprising contacting the cells or tissues, with (I), in vitro. (I) has antiinflammatory, cytostatic and antiinfectious activities. (I) is useful for inhibiting the expression of JKK-2 in human cells or tissues and prevents or delays infection, inflammation or tumour formation associated with altered expression of JKK-2 in human sale useful for detecting the levels of JKK-2 in a sample. The present sequence represents a phosphorothioate antisense oligonucleotide for human JKK-2, from the present invention

New antisense oligonucleotides, used for treating e.g. inflammatory conditions, psoriasis, graft rejection, cancers, infections, cardiovascular disorders or autoimmune disorders.

Example 16; Page 80; 199pp; English

This sequence is an antisense oligonuclectide of the invention. The antisense oligonuclectides are targeted to a nucleic acid encoding a cellular adhesion molecule (ZeM) and is capable of modulating the cepturession of the CAM. They particularly inhibit intercellular adhesion molecule. (ECAM) and is capable of modulating the capable intercellular adhesion molecule. (ECAM.). The antisense endoctides can be used to modulate CAM activity in mediating cell:cell interactions and subsequent cellular and biological responses, ceg. T cell activation, leukocyte transmigration and inflammation. The antisense sequences can be used for modulating the synthesis of a CAM. They can be used for treating an animal suspected of having or being they can be used for treating an inflammation. The condition can insense sequences can be used for treating an inflammatory disease or condition associated with a CAM. Oligonucleotides targeted to ICAM-1 can be used for treating an inflammatory disease or condition e.g. inflammatory bowel disease such as Crohn's disease or condition of the skin, e.g. psoriasis or condition c.g. inflammatory bowel disease such as Crohn's disease or condition of the skin, e.g. psoriasis or cyclotoxic dernatitis, rheumatoid arthritis, allograft rejection, cancer, pneumonia, multiple sclerosis or a viral infection. The ICAM-1 sequences or steducing cyclosporine use in a patient. The oligonucleotides can also be used for reducing corticosteroid use in a patient. The oligonucleotides can also be used for detection and diagnosis. They can also be used for treating e.g. thyperpoid disorders, uncommune forms of arthritis, mysathenia gravis, pemphigus come forms of juvenile diabetes mellitus, mysathenia gravis, pemphigus cyndscardial ischaemia/reperfasion innjury, dialated cardiomyopathy, acute come come come of the \*88888888888888888888888888888888888

Novel antisense compounds targeting nucleic acid encoding groEL or groES 

```
The present invention specifically claims AAH56368 to AAH56832 which are antisense oligonucleotides to nucleotide sequences encoding groE. More generally, antisense compounds (I) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a microorganism, where the antisense compound is complementary to GL or GS antisensementary to GL or GS is claimed. (I) have antibates there expression of GL or GS, is claimed. (I) have antibates thereby and antibition of expression of groES or groEL. (I) are useful for inhibiting expression of GL or GS in cells or tissues in vitro. (I) are useful for inhibiting the growth of a microorganism, or inhibiting cyloression of GL or GS gene in a microorganism, or inhibiting cyloression of GL or GS gene in a microorganism, (I). (I) are also useful for treating a mammalian pathological condition mediated by the microorganisms which involves identifying a eukaryotic organism is chaving a pathological condition mediated by microorganisms having a condition mediated by microorganisms having a condition mediated by microorganisms with involves identifying a eukaryotic organism is chaving a pathological condition mediated by microorganisms having a condition mediated by microorganisms having a condition mediated by microorganisms having a condition mediated by microorganisms and condition mediated for diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
gene of microorganism, which hybridize with and inhibit expression of the genes, useful to inhibit growth of microorganism having the genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                therapeutics, prophylaxis and as research reagents and Kits, e.g., to prevent or delay microbial infections in humans. They are also useful as molecular weight markers. AMH56362 to AMH56367 and AMH56831 to AAH56884 represent PCR primers for groß sequences which are used in the exemplification of the present invention. AMH56855 to AMH56870 represent

                                                                                                                                                                                                                     The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tumour; cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; tumour suppression; tumour reversion; apoptosis; viral resistance; human; viral infection; cell degeneration disease; neurodegeneration; ds; Alzheimer's disease; schizophrenia; immune disease; inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel human nucleic acid sequences (1). The present sequence is one such nucleic acid sequence. Expression of (1) are implicated in tumour suppression or reversion and apoptosis and viral
                                                                                                                                     Testing for the presence of polymorphisms associated with inflammatory bowel disease, using a hybridization assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid implicated e.g. in tumor suppression, useful for diagnosis of tumors, viral infection and cellular degeneration and for

identifying, measuring and/or amplifying nucleic acid sequences, as antisense reagents and for recombinant production of polypeptides (II) polypeptides (II) encoded by (I), vector containing (I), cells containing these vectors and antibodies (Ab) against (II) are all useful for treatment/prevention of viral, tumour and cell degeneration diseases (especially neurodegeneration, such as Alzheimer's disease and schizophrenia). Analysing the expression of (I) is also useful for diagnosis and/or prognosis of such diseases. Transgenic animals carrying (I) are used for studying the actiology of these diseases (also immune and inflammatory diseases). Note: In the present specification, SEQ ID 1 to 2280 are claimed in Claim 1, however only SEQ ID 1 to 2270 are shown
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hormone-sensitive lipase; antisense oligonucleotide; inhibitor; obesity; phosphorothioate; antidiabetic; anorectic; cytostatic; antisense therapy; abnormal metabolic condition; hyperlipidaemia; type 2 diabetes; cancer; hyperproliferative disorder; human; ss.

The present invention describes a compound (I) 8-50 nucleobases in length
                                                                                              targeted to a mucleic acid molecule encoding a hormone-sensitive lipase (HSL) or a splice variant of HSL. The compound specifically hybridises with and inhibits the expression of HSL or a splice variant of HSL, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding HSL. (I) have anorectic, antidabetic and cytostatic activities, and can be used in antisense therapy. (I) is useful for treating an animal, particularly human, hyperlipidaemia, type 2 diabetes, a hyperproliferative disorder such as cancer (e.g. pituitary, colorectal, breast, testicular, pulmonary or epithelial cancer). (I) is also useful in modulating blood glucose epithelial particularly plasma or serum glucose levels, in a diabetic animal. The present sequence represents a human hormone-sensitive lipase chimetic phosphorothioate antisense oligonucleotide, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide having a sequence complementary to a sequence of ribonucleic acid encoding a heparanase, useful for preparing a composition for treating tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
condition, e.g. hyperlipidemia and obesity, or a hyperproliferative disorder, e.g. cancer.

rejection, by contacting the allograft with a topical formulation comprising an antisense oligonucleotide targeted to intercellular adhesion molecule-1 (ICAM-1), extracellular adhesion molecule-1 (ICAM-1) or vascular cell adhesion molecule-1 (VCAM-1). The oligonucleotide is useful for inhibiting corneal allograft rejection or for preserving a corneal explant ex vivo, where the explant is human. This sequence corresponds to one of the oligonucleotide of the invention. Sequence 20 BP; 6 A; 5 C; 9 G; 0 T; 0 U; 0 Other; RESULT 913 Matches ADC35554/ 888888888 ઠ 셤 Complementary to a sequence of ribonucleic acid encoding a heparanase.

The oligonuclectide hybridises with the ribonucleic acid under conditions of high stringency and has a sequence comprising 10-40 bp. The citerior control of high stringency and has a sequence comprising 10-40 bp. The citerior control of the heparanase at least one phosphorothicate linkage. Hybridisation of the heparanase, where inhibition of heparanase was a least a 50% reduction in the quality of heparanase means at least a 50% reduction in the quality of heparanase masses. Also described: (1) a method of inhibiting expression of a heparanase in a cell; (2) a composition comprisising the above oligonucleotide in an amount effective to inhibit the expression of compassion of the heparanase in the cell and a carrier; and (3) a method of treating a cumour in a subject comprises administering to the subject and amount of the above oligonucleotide effective to inhibit expression of a heparanase in the subject. Heparanase antisense oligonucleotides have cytostatic the above oligonucleotide effective to inhibit expression of a heparanase in the subject composition for treating tumours. The present sequence represents a human heparanase phosphorothioate antisense oligonucleotide, which is used in the exemplification of the present invention ö Inhibiting corneal allograft rejection, by contacting an allograft with a formulation having an oligonucleotide targeted to intercellular adhesion molecule-1, extracellular adhesion molecule-1 or vascular cell adhesion 88; primer; immunosuppressive; antisense therapy; corneal allograft rejection; intercellular adhesion molecule-1; ICAM-1; extracellular adhesion molecule-1; BLAM-1; vascular cell adhesion molecule-1; VCAM-1; corneal explant. Gaps The present invention describes an oligonucleotide having a sequence The invention relates to a method of inhibiting corneal allograft ö 0.9%; Score 15.8; DB 1; Length 20; 89.5%; Pred. and inhibiting the expression of CD81. Also included is a composition comprising the antisense oligomorlectide and a carrier or a diluent. The antisense oligomorlectide and a carrier or a diluent. The antisense oligomorlectide is useful for inhibiting the expression of CD81 in cells or tissues. The antisense oligomorlectide is also useful for treating infections preferably viral, bacterial and parasitic and disease such as inflammatory discorders and autonimmune disorders. The disease or condition is characterised by chemical dependency (e.g. cocaine addiction). The present sequence is a CD81 antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel method for identifying an inhibitor on a gene vital for call growth or viability, and where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygostty (Loff) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene normal somatic cells, and the first gene. The products and methods can be
  nucleic acid molecule encoding CD81 (also known as TAPA-1, a tetraspanin)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymorphism; human, inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                                                                                                         Gaps

AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from differential efficacious responses to and side effects from N.B. The SEO ID NOS 2852, 2913, 2974, 3035, 3167, are not actually given a sequence in the Sequence Listing from the
used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human biallelic marker downstream amplification primer SEQ ID NO:10471.

This oligo(T) synthetic oligonuclectide was used for first strand cDNA synthesis from total RNA isolated from either logarithmically growing or quiescent 1011/2 mouse fibroblast cells. It was also used with an arbitarary d(N10) primer in PCR. The PCR products were used in a differential display to identify the mSARP1 gene (see AAV19112) that codes for novel murine secreted apoposis-related protein mSARP1 (see AAV39113-15) and polypeptides to SARP polynuclectides (see also AAV19113-15) and polypeptides (see also AAW37815-17), antibodies specific for SARP, and use of such polynuclectides and antibodies in disponent and therapeutic methods, and methods for treating diseases related to the regulation of SARP expression in tissue and body fluid samples, including

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles using defined primer sets, useful for subtyping or typing of HLA Class I alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for the locus-specific, separate amplification of exon 2, exon 3, and/or exon 4 of human leukocyte antigen (HLA)-A, HLA-B, or HLA-C alleles. The method is useful for subtyping or typing of HLA, class 1 alleles. The present sequence is an amplification primer used in the method

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma)*A-delta-N3'; where X = a labelled compound and/or nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine or thymine; A = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                        Peptides having at least two new nucleotides - useful as primers in RT-

Peptides having at least two new nucleotides - useful as primers in RT-

with a target sequence and contain a teast one phosphoro(di)thioate link, having endomuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to carrelate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endomucleases are used with DNA). The combination of modifications in (A) improves

resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead riboxyme sequences, and AAA24748 to AAA2592 represent their corresponding target sequences.

AAA2593 to AAA26105 represent oestrogen receptor hairpin riboxyme sequences, and AAA26107 to AAA2618 represent their corresponding target sequences. AAA2619 to AAA26171 represent their corresponding target sequences. AAA2619 to AAA26171 represent their sequences and antisense oligonucleotides used in the exemplification of the present

invention

New nucleic acids that interact, and optionally cleave, target sequences, used to treat cancer.

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, gamma = thymine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-FCR and determination of base sequences. The new

The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent cestrogen receptor hammerhead ribozyme sequences, and AAA24748 to AAA25992 represent their corresponding target sequences. AAA25993 to AAA26105 represent coefficient receptor hairpin ribozyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         present invention describes nucleic acids (A) that interact stably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequences. AAA26219 to AAA26271 represent other ribozyme sequences and

Bellon L;

```
with a target sequence and contain at least one phosphoro(di)thioate

link, having endonuclease activity. (A), and more generally any catalytic

nucleic acid (A) that modulates expression of the osetrogen receptor

gene, are used to treat cancer (particularly of breast or endometrium),

in vivo or by transforming cells ex vivo and implanting treated cells, or

for other conditions associated with levels of osetrogen receptor.

Because of the high selectivity for targeted RNA, (A) can also be used to

correlate inhibition of gene expression with alterations in phenotype,

particularly for identification of therapeutic targets, and as research

reagents (for RNA, in the same way that restriction endonucleases are

used with DNA). The combination of modifications in (A) improves

tesistance to nucleases, binding affinity and/or activity. AAA23503 to

AAA24748 to AAA2592 represent their corresponding target sequences.

AAA25931 to AAA2592 represent their corresponding target sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nucleic acids that interact, and optionally cleave, target sequences,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequences, and AAA26107 to AAA26218 represent their corresponding target sequences. AAA26219 to AAA26271 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present

and Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, central nervous system injury.

Claim 88; Page 131; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a DNAzyme) an NCH motif), a G-cleaver (cleaving RNA with a NRN motif) pran amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. Eurthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to RESULT 3.

AND ABER COLD 3.

treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular nonHodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
Leukaemia, Hiv (human immunodeficiency virus) associated NHL, mantle-cell
lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
immune thrombocytopaemia, and inflammatory arthropathy. The NOGOcrafetting nucleic acid is used to cleave RNA of the NOGO ene in the
presence of a divalent cation that is preferably Mg^2+. Furthermore, the
nucleic acid may be contacted with a cell to reduce NOGO activity of the
cell and treat a patient having a condition associated with the level of
NOGO. The treatment may further comprise the use of one or more
therapies. In particular, the NOGO-tragetting nucleic acid may be used to
treat central nervous system (CNS) injury and cerebrovascular accident
(CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS),
parkinson's disease, attaxia, Huntington's disease, Creutzfeldt-Jakob, disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is an amberzyme molecule of the invention

Probes for detecting target nucleotide sequence in sample, has sequence that forms hairpin structure having a double-stranded segment and singlestranded loop collectively forming region complementary to target sequence

3xample 4; Page 49; 72pp; English.

The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide · AGT02014. This is one of a set of oligonucleotides (see ABA91527-30) used

```
to assess the minimum number of ribonucleotides in DNA-RNA chimeric oligonucleotides required for Rhase H cleavage. Each oligonucleotide of the get had a different number of ribonucleotides, 1 in the present case. The oligonucleotides were mixed with target DNA oligonucleotide AGT02009 (See ABA91531) and incubated with Rhase H (5 U/ml) at 37 degrees C for 30 minutes. The results showed that 4 ribonucleotides were the minimum number for RNA cleavage. The invention provides probes for nucleic acid hybridisation. The probes form a hairpin structure comprising a doublestranded stem and a single-stranded loop, and are capable of both intramolecular and intermolecular hybridisation. The double-stranded stem may comprise a methylphosphonate DNA, RNA hybrid that is resistant to RNAse H cleavage. When the probe hybridisation that is resistant to strand in the DNA, RNA duplex becomes sensitive to RNAse H treatment and can be removed. Arrays and methods for nucleic acid hybridisation using

useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome. Novel polynucleotide which down regulates expression of Ets-related useful for treating cancer. disheria wattannon treating

Claim 4; Page 92; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma,

```
tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgarie, angiofibroma of tuberrous sclerosis, port-wine stains, Sturge Weber syndrome, Nippel-Trenaunay-Weber syndrome, Oaler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for creating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies the treatment. The method comprises the use of one or more therapies or under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ARK1354-ABK22719 represent nucleic acide, including antisense and enzymatic nucleic acide, including antisense and enzymatic nucleic acide, including antisense and

Sequential consensus region-directed amplification for sorting mixture DNAs into 2 or more subsets or distinguishing gene expression patterns 2 samples, useful for disease diagnosis and gene analysis.

The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ21. MDZ3 is cancoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 1601.2 and MDZ12 is encoded at chromosome 1602.2 and MDZ12 is encoded at chromosome 1602.2 and MDZ1, mDZ2, and MDZ12 is encoded at chromosome 1502.2 and MDZ1, mDZ2, and MDZ12 is encoded at chromosome 1502.2 associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ4, MDZ7, or MDZ12, encoder at sease acides and proteins are also useful for diagnoshing or monitoring a disease acide can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acides can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ7, or MDZ12 genetic locus. The probes are proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as
distinguishing gene expression patterns in 2 samples. The methods, kits and oligonuclectides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease diagnosis and gene analysis. The present sequence is oligo AT PCR primer used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MD23; MD27; MD21; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is concoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome concoder in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23. MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids and also be used as probes to detect and characterize gross alterations in MD23, MD24, MD212 genetic locus. The probes are useful as therapeutic agents for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The oligomer was designed to target human TNF receptor mRNA beginning at nucleotide 2354 and to covalently cross-link to the target via the N4N4-ethanocytosine group. See also AAQ20108
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New sequence-specific non-photo-activated crosslinking agents - bind to
the major groove of duplex DNA and are esp. useful for treating latent
infections e.g. HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             deoxyribonucleic acid; major groove; ethanoamino group;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaccuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg, a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-448. The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duptex. The specific target sequence of this oligomer is the human tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets. e.g. HPV, HER, HIV, heparattis B, herpes, malignant tumours and inflammation. The triple bubjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-447. (Updated on 25-MAR-2003 to correct PD field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human tumour necrosis factor receptor mRNA; AIDS; modified; HIV; RSV; HPV; malignancy; hepatitis; inflammation; 88.
                                                                                                                          New oligomers contg. modified bases - which form a triplex with G-C doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis, herpes malignancy and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oligomer TNFR942 for forming triplex with HUMNFR target duplex.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                       The sequence depicts a HUMNFR (tumour necrosis factor receptor) mRNA sequence beginning at nuclectide 2354. The sequence is a viral duplex sequence contg. a purine-rich region concentrated on one chain of the duplex. The sequence may be prepd. by standard DNA synthesis. The HUMNFR duplex sequence is used as a target for novel oligomers which are capable of forming a triplex at physiological pH by coupling into the major groove of the DNA duplex. Three such oligomers TNFR 941-32 are capable of forming a triplex with this sequence. The oligomers are used in the treatment of inflammation. Similar oligomers may be used to target viral DNA duplexes specific for HIV, herpes and other viruses. The triple helices form under mild conditions thus assays may be carried out without inhibit gene expression, as verified by in vitro systems. See also

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-448.         This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. ```
This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel apoptosis-related DNAs and proteins - for diagnosis, preventing treating diseases associated with apoptosis.

The present sequence represents a probe used to isolate human bone morphogenetic protein-16 (BMP-16) cDNA. Human BMP-16 is a homologue of a murine protein celled nodal, which is expressed in the mouse node during castrulation. BMP-16 cDNA is isolated from a human genomic library screened with a probe derived from the nodal DNA sequence. The BMP-16 proteins can induce the formation of bone, cartilage or other connective tissue. They can be used for treating bone, cartilage or other connective tissues and wounds. They can also increase neuronal, astrocytic and glial cell survival and therefore be useful in transplantation and treatment of call survival and therefore be useful in transplantation and treatment of conditions exhibiting a decrease in neuronal survival and repair. They can also exhibit properties, and effects on cells including induction of chemoattractant properties, and effects on cells including induction of collagen synthesis, fibrosis, differentiation responses, cell adhesion, migration and extracellular matrices. These properties make the proteins potential agents for wound healing, reduction of fibrosis and reduction of scar and responses in a reduction of scar and responses.

The invention relates to identification of genes and proteins of adipose itsease relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnes ayndrome. The genes (AAZ90631-633) and the proteins (AAY67598-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                   A physiologically active protein specifically derived from mammal tissue.
                                                                                                  Adipose tissue, obesity, diabetes; hyperlipemia, hypertension, human, arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.

```
tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperunicemia and sleep apnea syndrome. The genes (AAZ90631-633) and the proteins (AAY67598-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A physiologically active protein specifically derived from mammal tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to identification of genes and proteins of adipose
                                                                                                                                                                                                                                                                                                                             Adipose tissue, obesity, diabetes; hyperlipemia; hypertension, human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Adipose tissue; obesity; diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; se.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       represent PCR primers amplifying the human adipose tissue genes
